SONeT is a dedicated neonatal transfer service designed to move babies from one hospital to another for specialised or ongoing care across Thames Valley and Wessex Neonatal Network. SONeT operates from two hubs

- a) Oxford Hub- covering north patch
- b) Southampton Hub- covering south patch

SONeT Oxford Hub

Level 2, Neonatal Unit
Women Centre
Oxford University Hospital, Oxford
OX3 9DU
Email: sonettransport@nhs.net

SONeT Southampton Hub

Transport office,
Neonatal Intensive care Unit
Mail Point 607
Princess Anne Hospital
University Hospital Southampton
SO16 5YA
Email: UHS.SONeT@nhs.net

If you have any comments about the SONeT service, please talk to a member of staff or use the feedback form that the team gives you or you can email us on the above emails.

Southampton Oxford Neonatal Transport

Parent and Carers Information Leaflet

This leaflet is to help you understand why your baby is being transferred to another hospital. It is also intended to give you information about the Southampton Oxford Newborn Emergency Transport (SONeT) Service.

Your baby's name _____
Date of birth _____ Birthweight _____
Your baby is being transferred to _____
Telephone _____
The transport team is _____ hub
Nurse _____
Doctor/ANNP _____
Ambulance Driver _____

We understand that this is an extremely stressful time for you and we will try to help you in any way we can.

Why is my baby being transferred?

Your baby is being transferred to another hospital to receive specialist care. This type of care is not possible where your baby is currently being cared for.

There are many reasons why a baby may require specialised care. These include prematurity, breathing problems, congenital abnormalities, problems due to difficult birth and requiring surgery.

How is my baby cared for during transfer?

The doctors at your hospital will contact the SONEt transport team who will travel to the hospital in a specially equipped ambulance. The transport team has a nurse and a doctor or advanced neonatal nurse practitioner that are specially trained in caring for sick babies who are being transported.

The team will evaluate your baby's condition and perform any procedures that are necessary to prepare and stabilise your baby ready for transfer.

Explaining the transport equipment

The SONEt equipment provides everything needed to transport even for the most critically ill babies. The equipment includes

- The incubator- a perspex enclosure around your baby, which will keep your baby warm and comfortable.
- The ventilator- breathing problems are one of the common reasons for transferring a baby. The ventilator will help to stabilise your baby's breathing.
- Monitors- during the transfer it is important that we monitor your baby's condition continuously. We measure heartbeat, breathing rate, temperature and blood pressure.
- Syringes for medication - Some baby's need special medication or intravenous fluids, the SONEt team can provide these when necessary. We can also transfer any breast milk you have produced.

Your baby is in very safe hands

After the SONEt team have completed preparing your baby for transport you will be able to see your baby. The team members will explain what treatment your baby is receiving and answer any questions you might have.

Please don't be scared to touch or kiss your baby.

Being with your baby during transfer

The SONEt team (and your hospital) will tell you if it is possible for you or your partner to accompany your baby during the transfer. This depends on your baby's condition, space and safety issues. If it is possible for you to travel, you can bring only one small piece of hand luggage.

It may be that you will have to arrange your own transport to the hospital that your baby is being transferred to. SONEt team will provide you with the hospital information and take your contact details. It is important that you **do not try to follow the ambulance**- this can be dangerous.

If you are still an inpatient at the hospital where your baby was born, it may be possible to be transferred to the same hospital. The timing of transfer will depend on your current condition and the transfer will be arranged by your local hospital.

The SONEt team will let you know when they have arrived at the receiving hospital with your baby. All hospitals encourage parents to telephone and enquire about their baby. We suggest telephoning the hospital one or two hours after your baby reaches the receiving hospital. This allows the team to give you up to date information.

Moving baby closer to home

When your baby no longer requires intensive care, the SONEt transport service will transfer your baby back to a hospital nearer your home. Your local hospital will support you and your baby until your baby is ready to be discharged home. This will be discussed with you as well as with your local doctor and hospital.
